Product Information

Mining pallet is a kind of supporting equipment used in mining engineering and coal mining engineering, mainly used to support and fix pipes, cables, ventilation equipment, etc. in mines. It is usually made of metal materials and has the characteristics of durability and corrosion resistance.

Product Introduction-Features

1. Corrosion resistance: mining pallets are usually made of galvanized or stainless steel materials, with good corrosion resistance, suitable for use in humid and corrosive environments.
2. High strength: mining pallets are made of materials such as steel or aluminum alloy, with high strength and load-bearing capacity, and can withstand the weight of equipment such as pipelines and cables.
3. Stable structure: The design structure of mining pallets is stable, which can effectively support and fix pipelines and cables to maintain their stable operation.
4. Easy installation: mining pallets are easy to install and are usually fixed to the mine wall by bolts or welding, without the need for complex tools and equipment.
5. Economical and practical: mining pallets are an economical and practical mine support equipment that can improve work efficiency and reduce maintenance costs.
6. Mining pallets are widely used in coal mining engineering, metal mines, underground engineering and other fields. They are an important support equipment and play an important role in the safe operation of equipment such as pipelines and cables in mines.
