Product Information

Anchor cable tray is a kind of support equipment used in mining and underground engineering, mainly used to fix and support anchor cables. Anchor cables are usually steel cables or cables used to fix and reinforce mines, tunnels or other underground structures, while anchor cable trays are used to support and fix these anchor cables to ensure their stability and safety in the project.

Product Introduction

The anchor cable tray is widely used in coal mining engineering, tunnel engineering, basement engineering and other fields. It is an important underground engineering support equipment and plays an important role in the stable operation of the anchor cable in the project.

Product Introduction-Features

1. High strength: The anchor cable tray is usually made of high-strength steel and has sufficient load-bearing capacity to support and fix the weight and tension of the anchor cable.
2. Corrosion resistance: Since the anchor cable tray is often used in humid and corrosive environments, it is usually made of anti-corrosion treatment or stainless steel materials with good corrosion resistance.
3. Stable structure: The design structure of the anchor cable tray is stable, which can effectively support and fix the anchor cable to ensure its stable operation.
4. Easy installation: The anchor cable tray is easy to install and is usually fixed in the underground structure by bolts or welding, without the need for complex tools and equipment.
5. Economical and practical: The anchor cable tray is an economical and practical underground engineering support equipment that can improve work efficiency and reduce maintenance costs.
