

Pick Series

PICK SUPPORTING - TOOTH BOOT SERIES

The mine pick boot is an important accessory of the mine pick, generally installed on the top of the pick, playing the role of protecting the pick and enhancing wear resistance. During coal mining and other operations, the pick will continuously contact with coal, rock and other media and generate friction. The pick boot can share part of the wear, extend the service life of the pick, and ensure the continuous and efficient operation of the mining equipment.
