

+ Submersible slurry pump

+ Product Introduction +

The submersible slurry pump is a dedicated underwater slurry conveying device featuring an integrated motor and pump body. Its core purpose is to directly handle slurries containing solid particles underwater. Breaking the limitations of traditional pumps, which rely on piping for separate motor and pump body connections, it can operate directly in slurry media. It efficiently handles high-solids, high-wear underwater applications such as underground mine slag discharge, river dredging, sewage treatment plant sludge transportation, and metallurgical slag discharge. It provides a compact and efficient slurry conveying solution for handling slurries in harsh underwater conditions.
