

Fractional slurry pump ++

+ Product Introduction +

The Fractional Slurry Pump is a slurry conveying device specifically designed for low-flow, high-lift applications. Its core focus is the precise conveying of slurries containing solid particles. Its design is fully adapted for demanding applications in mining, metallurgy, and chemical industries, where flow control and lift requirements are stringent. It efficiently handles the conveying needs of various solid-laden slurries, providing a stable solution for critical slurry handling processes in industrial production.
