

+ Pipeline pump

+ Product Introduction +

Pipeline pumps are centrifugal pumps designed specifically for conveying media within pipeline systems. They utilize a "direct-connect" installation structure, allowing them to be connected directly in series within pipelines without the need for complex foundation construction. They are widely used in applications such as building water supply/drainage, industrial circulating water, HVAC, municipal water supply, and agricultural irrigation. Their core advantages lie in their compact design, adaptable to pipeline systems, and their efficient conveying capabilities. They can meet the stable delivery requirements of media (such as clean water and mildly corrosive liquids) in a variety of scenarios, making them key equipment for pipeline fluid circulation and delivery.
