

MYH Slurry Pump

SLURRY PUMP

Features

Single-stage, single-suction, cantilevered horizontal centrifugal slurry pump; robust structure and reliable operation.

Thick, wear-resistant flow components, with heavy-duty brackets, suitable for highly abrasive, high-concentration or low-concentration high-lift slurries.

Multiple stages can be connected in series within the maximum permissible working pressure range to meet long-distance transportation needs.

The pump features a dual-casing structure with an inner liner made of either wear-resistant metal or rubber, allowing for replacement only after wear is complete. This design ensures long maintenance cycles and low operating costs.
